

## Improve security and access control

### The challenge: Efficiently secure restricted facilities

The guard steps out of the gatehouse and scans the scene as the vehicle approaches the military facility. As the vehicle stops at the gate, the guard walks up and asks the visitor for identification. The visitor pulls out his wallet and hands over his driver's license.

This is a critical moment. The guard needs to know—with absolute certainty—if the visitor is a threat, which areas he is permitted access to, and during what days and hours. He walks back to the guardhouse to enter the ID into a security system, losing visual contact and vital time. At the same time, the line of traffic builds during peak visiting hours. Intellicheck changes all of that.

### THE INTELLICHECK SOLUTION: Enhanced security, efficient access control

Intellicheck Defense ID® makes that loss of time and visual contact a thing of the past, by enabling security personnel at restricted facilities to instantly authenticate visitor, vendor and staff ID using a hand-held mobile device.

With Defense ID, the guard simply scans the barcode on the visitor's ID credentials, and within a few seconds, it is authenticated. Critical record fields

from criminal, DMV and custom databases are available and highlighted, and visible at a glance. Threat levels are also factored in the display, so the guard instantly knows his situation. That means lower risk and increased security.

Based on the information returned during the records search, the guard is now certain that the visitor is authorized to have limited access to the facility. At this point Defense ID makes it easy for the facility to register the visitor and issue customized, rules-based credentials that limit their access to specific areas and specific times. And if threat levels rise, that access can be immediately revoked.

### Rules-based access control

Makes it fast and easy for security personnel to issue customized, rules-based access credentials that restrict visitors to specific areas, times, or aligned with specific situations, such as increased threat levels.

### Increases security and safety

Works on mobile devices to minimize loss of visual contact at access points and throughout a facility, while ensuring guards always have one hand free. Instantly highlights critical data fields that indicate the threat level based on custom database, DMV and criminal records search.

### Accurate and up-to-date data

Patented ID verification technology authenticates more than 200 unique driver's license barcode formats, from every state and Canadian province, and can query many official law enforcement data sources, including DMV, state and FBI records. Ongoing updates ensure that data is always current.

### Integrates with custom databases

Makes it easy to quickly extend authentication capabilities via integration with custom databases.

### Expert consulting, subscription pricing

Our professional services team of authentication experts works with you to integrate Defense ID with existing systems and custom databases, and to add analytics capabilities for a seamless deployment. Available with subscription pricing or as a customized solution.
